(54) Signal amplifying circuit

(57) In a signal amplifying circuit connected to a transfer circuit having a known non-linear transfer characteristic and a transient characteristic, a threshold generation circuit generates a threshold signal based on an input signal, a threshold control circuit controls the threshold signal so as to correct the non-linear transfer characteristic of the transfer circuit provided at a former stage based on the input signal. Also, basic amplifying circuit blocks can be connected in a multistage form, each of which is composed of a threshold generation

circuit and a differential amplifying circuit, and control the threshold signal of a latter stage block so as to correct the non-linear transfer characteristic of a basic amplifying circuit block at a former stage based on the input signal. In addition, basic amplifying circuit blocks can be connected in a multistage form, each of which includes a peak master-slave threshold generation circuit or a bottom master-slave threshold generation circuit, and control the threshold signal of the differential amplifying circuit of each circuit block.

**ANNEX TO THE EUROPEAN SEARCH REPORT
ON EUROPEAN PATENT APPLICATION NO.**

EP 99 11 4249

This annex lists the patent family members relating to the patent documents cited in the above-mentioned European search report.
The members are as contained in the European Patent Office EDP file on
The European Patent Office is in no way liable for these particulars which are merely given for the purpose of information.
